

This is a WordPress plugin that adds a new page to the WordPress admin panel in the "Settings" menu. The page, called "QA Test", allows users to enter various options and perform tests to ensure that all fields work correctly. The plugin includes fields for the user's full name, nickname, address, date of birth, email address, and website. The plugin also includes a form for submitting test results, including a description of the tests performed and whether they passed or failed. The plugin uses the WordPress Configuration API to handle the form submission and save the data to the database.

Analysis

) The error message "Warning: Trying to access array offset on value of type bool" is occurring on line 23 of the "qa-test.php" file and indicates that the code is trying to access an array offset (a element of an array), but the value being accessed is actually a boolean (true or false). This usually happens when the code tries to access an element of an array, but the array is not set or is empty.

To fix this error, you can check if the option has been set and exists before trying to access it. You can do this by using the `isset()` or `empty()` function to check if the option is set before trying to access it.

Website address including protocol

* - required fields

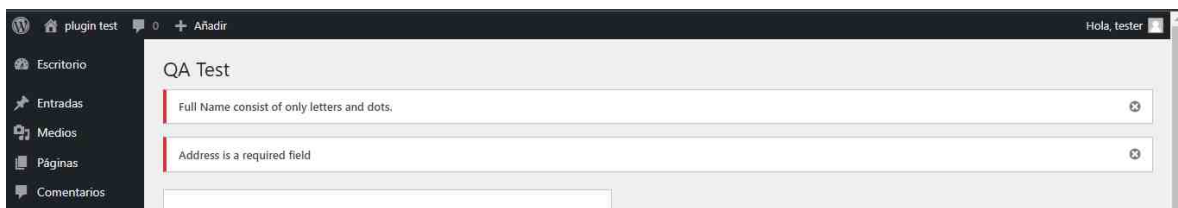

Server: 127.0.0.1 » Database: plugin_test » Table: wp_options

Browse Structure SQL Search Insert Export Import Privileges Operations Tracking Triggers

Function	Null	Value
20) unsigned		183
char(191)		qa_test_options
		a:6:{s:16:"qa_test_fullname";s:18:"Jeferson Hernandez";s:15:"qa_test_address";s:15:"Calle 75N 36B01";s:13:"qa_test_email";s:29:"jefersonhernandez81@gmail.com";s:13:"qa_test_dob_m";s:1:"9";s:13:"qa_test_dob_d";s:2:"28";s:13:"qa_test_dob_y";s:4:"1995";}

Console

- Does not save the Nickname and Website values in DB.
- Validates the website field and if it does not have a value it displays an error message, but it should not because it is not marked as required.
- Nickname is not validated in this field and it needs to be validated because it is marked as required.
- Address displays a message that is required but is not marked as required.
- Date of Birth Day shows the option of negative numbers and those greater than 31, which is not valid for the user experience because it must be the range of days of the month.
- Date of Birth Year only allows numbers but saves values when letters are added.
- Email Address is marked as required but it is not validated. And it updates the database if the field is empty, it only validates if it is an email when they write.
- If all the fields are empty, it also saves the data. ""

- It shows error messages and required fields, but should not let you update data if the fields are not correct.
- Full name mtras the Full Name consist of only letters and dots error, but allows data to be updated even if numbers are used.

Notes

1. The debugging and error logging mode was activated to verify in detail.
2. Use comments to describe the purpose of each section of the code and make it more readable.
3. Use variable names and descriptive functions to reflect their purpose.
4. Use indentation to indicate the structure of code blocks.
5. Separate the code into different files to keep it tidy and easy to maintain.
6. Use constants for values that are used in various parts of the code.
7. Use the standard WordPress coding style to ensure compatibility and readability.
8. Use functions and classes to encapsulate code and make it easier to understand and maintain.

9. Use the `esc_attr_e` function to escape tag values and avoid security issues.
10. Use the `isset()` or `empty()` function to check if a variable is defined before using it.
11. Use the `get_option()` function only after verifying that the option exists, to avoid Warning issues.
